

How to Fix the Vercel 404 NOT FOUND Error

This error occurs when Vercel cannot find the package.json file in the folder you uploaded. This usually happens because Windows unzips files into an extra parent folder.

Step-by-Step Fix:

1. Extract the ZIP file

Right-click "save-money-app-v2.zip" and choose "Extract All...".

2. Open the extracted folder

Double click into the extracted folder. Keep opening folders until you see a file named exactly "package.json" (along with src, public, etc).

3. Identify the Correct Folder

The folder you are currently inside (the one that contains package.json) is the ONLY folder you should upload to Vercel.

4. Upload to Vercel

Go to your Vercel Dashboard, click Add New -> Project. Go up one level in your file explorer, and DRAG THAT SPECIFIC FOLDER (the one containing package.json) directly into the Vercel browser window.

5. Wait for Build

Vercel will detect it as a Next.js App Router project and deploy it. The 404 error will be gone!

Note: Your Next.js app is also running locally. You can always view it instantly without deploying by opening <http://localhost:3000> in your browser.
